HackerOne · Intigriti · Bugcrowd: **sand666wind**

PROFILE

Offensive security engineer and penetration tester. Build security tooling in Python and C++, with hands-on experience in security assessments, OSINT, vulnerability research, and responsible disclosure. Final-year Computer Engineering student with additional research experience in algorithms, AI, and combinatorial optimization.

EDUCATION

B.Sc. in Computer Engineering — Antioch Private Syrian University, Damascus, Syria
2022 – 2027 (Expected)

CORE COMPETENCIES

Offensive Security: Web Application & API Penetration Testing · OSINT · Vulnerability Assessment · Responsible Disclosure · Cryptography · CTFs · Bug Bounty Methodology · SIEM Fundamentals

Security Engineering: Security Tool Development · HTTP / Raw-Socket Engineering · Python · Senior C++ (OOP, SOLID Principles, Design Patterns, Clean Architecture) · Bash/Shell · SQL

Machine Learning & Mathematics: Unsupervised Learning · Autoencoders · Neural Networks · Fuzzy Logic · Combinatorial Optimization · Number Theory · Linear Algebra · NumPy · Pandas · scikit-learn · Matplotlib · MATLAB

Research Methods: Experimental Design · Statistical Testing (Paired t-tests) · Benchmarking · Reproducibility · Technical Writing

SECURITY EXPERIENCE

Security Assessments — Syrian Organizations

Black-box penetration testing of Syrian university and commercial web portals, and an OSINT-driven assessment of a public-sector portal. Discovered and reported 15+ findings on the university portal, including exposed remote-management services, and multiple high- and critical-severity findings on the public-sector portal. Reports acknowledged by the owners; client and finding details withheld under confidentiality.

SECURITY ENGINEERING

Beast403 — Accuracy-First 403/401 Bypass Scanner *Python · github.com/sand8storm/Beast403*

Verification-first scanner that validates candidate bypasses against live per-target oracles using SimHash structural classification, with a raw-socket engine to defeat client-side path normalization. Independent four-server benchmark: 100% precision, zero false positives across 28 negative targets, and 67% recall with the gap root-caused and a fix scoped.

SSTIeye — Server-Side Template Injection Scanner *Python · In Progress*

Verification-first SSTI scanner using randomized arithmetic probes confirmed against a baseline response, distinguishing real template evaluation from reflection. Consumes raw HTTP request files to reach authenticated endpoints; tests both headers and parameters.

RESEARCH & ALGORITHMS

TSP Heuristics — A Systematic Empirical Study

Benchmarked 20+ construction, local-search, and metaheuristic methods for the Euclidean TSP, including four original construction rules, under a significance-tested protocol. Found Farthest Insertion empirically dominant among construction rules and a Lin–Kernighan-style local search dominant overall — a 12-stage metaheuristic hybrid improved on it by under 0.5%.

LKH Candidate Generation — Independent Verification

Investigated the candidate-generation stage of the Lin–Kernighan–Helsgaun heuristic. A purely topological candidate set ($MST \cup \text{Delaunay} \cup k\text{-NN}$) matched evaluated α -nearness candidate quality at roughly 20× higher speed, framed as independent verification rather than a novel contribution.

Riemann Zeta Zeros — Machine-Learning Analysis

Applied an autoencoder-based unsupervised learning approach to non-trivial zeros of the Riemann zeta function, using Odlyzko's dataset to investigate potential structural patterns.

CERTIFICATIONS

Introduction to Cybersecurity — Cisco Networking Academy, 2026
Introduction to OSINT — Security Blue Team, 2025
CompTIA PenTest+ (PT0-003) Exam Preparation — Packt via Coursera, 2025
